Intermediate Power BI and Jupyter Notebook

Introduction:

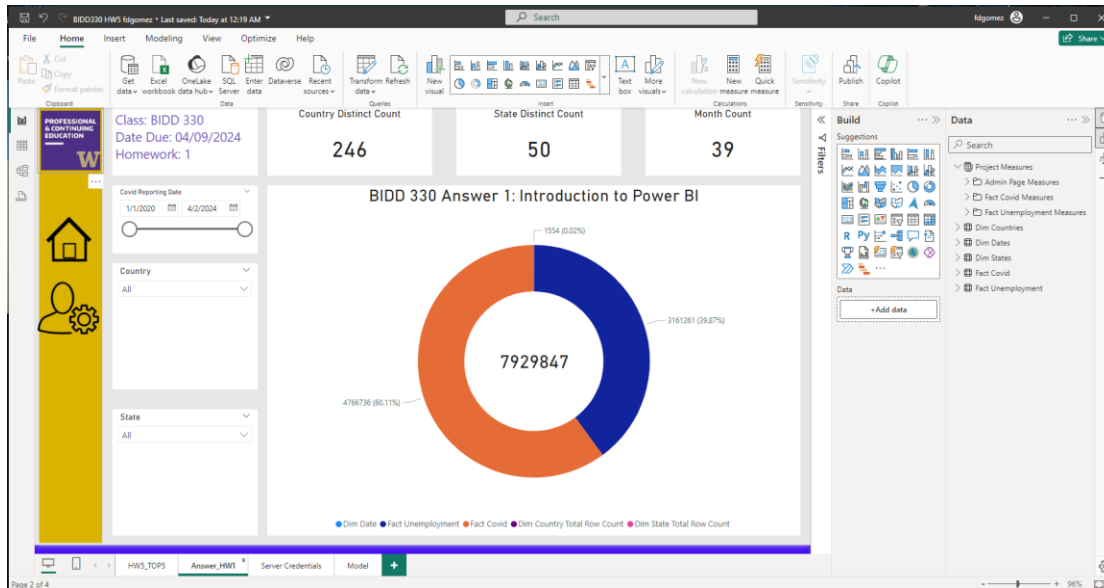

For module 05, we focus on developing an Intermediate Power BI report that builds from our previous HW1 Power BI assignment. We also focus on making updates from a jupyter notebook that is running python code to connect to our Black_Unemployment database and run data science experiments on our data. We copy over 2 images from our guest speaker's presentation and show them in our jupyter notebook. In our assignment, we perform "Intermediate" updates to our initial Power BI report, that demonstrate what someone who would be considered an intermediate at Power BI would be able to do.

For the Power BI updates, we focus on more difficult concepts that any BI Developer or Data Analyst would be required to learn. Some of the concepts included moving from materialized tables to views. We either create the views in our data warehouse and switch our connections to those views or we can write SQL code instead in our Power BI connection settings. We also focus on adding certain features like bookmarks to navigate through the report, we add Top 5 N charts for a certain category based on a certain value, slicers that control the report based on our Date Dimension, complex DAX calculations inside a measure table and finally publish to our UW PBI workspace.

Our final Power BI intermediate report looks as below:

Our Power BI report focuses on TOP 5 for all our donut visualizations. We include our two navigation bookmarks, which are the “Home” and “Admin” buttons. They take us to different pages of our report. The “Home” bookmark is our main page shown above and our “Admin” bookmark gives us details about the row count from our dimensions and fact tables.

Lastly, for our Power BI report, we can see that we have our connections switched from our materialized tables to our views that were generated. For example, below is our updated Fact Covid table that is now pointing to our new view “vFactCovid”:

Fact Covid Key	ID	Updated	Confirmed	Confirmed_Change	Deaths	Deaths_Change	Recovered	Recovered_Change
752380	235929	3/26/2020	23	0	0	0	9	0
752381	260299	3/21/2020	24	1	0	0	9	0
752382	569288	3/23/2020	31	4	0	0	9	0
752383	714577	3/24/2020	33	2	0	0	11	0
752384	819816	3/25/2020	37	4	0	0	11	0
752385	1140344	3/26/2020	41	4	0	0	11	0
752386	1248881	3/27/2020	41	0	0	0	11	0
752387	1405134	3/28/2020	55	14	0	0	11	0
752388	1490989	3/29/2020	85	30	0	0	11	0
752389	412380	3/20/2020	211	0	0	0	0	0
778601	626573	3/22/2020	175	163	0	0	0	0
778602	958027	3/23/2020	396	221	0	0	0	0
778603	1086356	3/25/2020	458	40	1	0	0	0
778604	1105001	3/26/2020	512	54	2	1	0	0
778605	2878133	4/2/2020	877	41	11	2	0	0
778606	3553437	4/4/2020	958	37	12	2	0	0
778607	3920824	4/5/2020	971	15	12	0	0	0
778608	3988811	4/6/2020	987	16	12	0	0	0
778609	4104004	4/7/2020	1030	33	12	0	0	0
778611	413282	3/20/2020	216	0	0	0	0	0
778612	626875	3/22/2020	249	17	0	0	0	0
778613	958029	3/23/2020	394	145	1	0	0	0
778614	1086358	3/25/2020	468	37	1	0	0	0
778615	1105003	3/26/2020	542	74	4	3	0	0
778616	2878135	4/2/2020	982	63	9	2	0	0
778617	3553439	4/4/2020	1140	79	10	1	0	0
778618	3920826	4/5/2020	1176	36	12	2	0	0

For our Jupyter Notebook assignment, we are given the task of either switching connections to in our Python script to our own connections or copying two charts from the script in the presentation.

We initially try to connect to our database using our credentials, so we make updates to our connection string for connecting to our data warehouse in SQL Server. Below is a screenshot of our updates comparing the old to our new and updated code:

# Make sure to close your connection
conn.close()
```

We also update include screenshots of two of the visualizations provided by our guest speaker Matt in his Python script:

2)

These are two visualizations using the Seaborn API library in Python.

Summary:

In summary, we further investigate our Covid dataset by utilizing intermediate concepts in Power BI to develop meaningful visualizations that give us insights on the Covid data. Developing the intermediate level Power BI report requires grasping new concepts that take us to the next level, especially when it comes to the navigation panel and our new DAX equations. The jupyter notebook updates requires us to understand a bit of Python code and how to connect to our data warehouse using the api library pyodbc. Overall this assignment helped provide us with some insight into how to navigate through a jupyter notebook script and make updates to our Power BI reports.
